### **Clinical information :**

Rule out fracture. Rule out AS. S/P THA left. Osteoporosis.

### **LUMBAR SPINE**

#### **Findings :**

Standing A.-P., and lateral views of the lumbar spine show changes of moderate degenerative disc disease involving the lower dorsal spine extending down to L2.

The lumbar spine is, otherwise, normal.

### **SACROILIAC JOINTS**

#### **Findings :**

A.-P., and oblique views of the sacroiliac joints show minimal sclerosis involving the right sacroiliac joint consistent with degenerative disease.

No other abnormality.

### **DORSAL SPINE**

#### **Findings :**

There are changes of moderate degenerative disc disease seen in the lower dorsal spine.

No other abnormality.

### **PELVIS**

#### **Findings :**

An. A.-P., view of the pelvis shows a total hip replacement on the left side.

The prosthesis elements are in good position without evidence of loosening or other complications.

There are changes of moderate degenerative osteoarthritis involving the right hip joint. The pelvis is, otherwise, normal.

## **BONE DENSITOMETRY**

### **Findings :**

Sampling from L2 to L4 shows B.M.D., of 0.776 g/cm.2, which represents a T-score of -3.5, indicating marked osteoporosis.

Sampling from the left femoral neck, shows B.M.D., of 0.691g/cm.2, which represents a T-score of -2.4, indicating osteopenia (borderline osteoporosis)

The lower of the T-scores applies.
