## LUMBAR SPINE AND BONE MINERAL DENSITY

A single lateral of the lumbar spine prior to a bone mineral density shows small multilevel osteophytes.

Sampling at the level of the lumbar spine from L2 to L4 gives a bone mineral density of 0.917 g/cm<sup>2</sup> corresponding to a T-score of -2.4. Compared to previously there has been a very significant increase of 18.2% at that level.

At the femoral neck, the bone mineral density is 0.821 g/cm<sup>2</sup> corresponding to a T-score of -1.3. Compared to previously, there has been also a very significant increase of 14.8% at that level.

**This patient is osteopenic. Her present fracture risk is moderate. Treatment should be continued and a follow-up is recommended in 1 to 2 years to monitor her response to therapy.**
